1 Quiz 4

Solution for 1. b): (s,w) will be the shortest path from s to w, however, it will never determine any other shortest path during this step. \square

Solution for 4. Here is an counter example.

By greedy algorithm: $c_1 \rightarrow c_4 \rightarrow c_3 \rightarrow c_2 \rightarrow c_1 = 2 + 4 + 1 + 9 = 16$.

While the optimal solution is: $c_1 \rightarrow c_4 \rightarrow c_2 \rightarrow c_3 \rightarrow c_1 = 2 + 5 + 1 + 3 = 11$.

\square

Solution for 5. I didn't notice we only need to prove the denomination 1 case, so I only need to provide why g_1 and n_1 is from 0 to 5. The whole proof would be:

Let $c = \{c_1 = 1, c_2 = 5, c_3 = 10, c_4 = 5^2\}$

Suppose we have $X = \{x_1, x_2, x_3, x_4\}$ be the optimal solution.

Let $g = \{g_1, g_2, g_3, g_4\}$ be the solution to our greedy algorithm.

Now we need to prove that $\sum_{i=1}^4 x_i c_i = \sum_{i=1}^4 g_i c_i$:

$$x_1 + 5x_2 + 10x_3 + 25x_4 = g_1 + 5g_2 + 10g_3 + 25g_4$$

reducing the equation by mod 5 yielding $x_1 \equiv g_1 \pmod{5}$.

$0 \leq g_1 < 5$ because greedy algorithm will choose larger denomination if g_1 is larger than or equal than 5 in last selection.

$0 \leq n_1 < 5$ because optimal solution will reduce the amount of n_1 . However, if n_1 is larger than 5, it could not be the optimal solution.

Thus $n_1 = g_1 \pmod{5}$, and $n_1 = g_1$. □

| | Implication satisfied | X | Y | New Assignment? | check |
|----------------------------------|-----------------------|---|---|-----------------|-------|
| initial | | F | F | | |
| Row 1 $\Rightarrow X$ | No | T | F | Y | |
| Row 2 $X \wedge Y \Rightarrow Y$ | Yes | | | No | |
| Row 3 $\neg Y$ | | | | | T |
| Row 4: Final Assignment | | F | F | | |

Solution for 6.

After X change to true from false, " X and Y " will maintain false. " $\text{false} \rightarrow \text{false}$ " statement will maintain true. And all the following result will change as well. Y would stay F, check would be true. □
